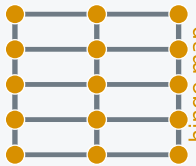
Recoverability is a state-space crossing

The hinge map changes the path by which a frame reaches the barrier.

1 State at release

frame + hinge map
state: u, v, S, F_y



released at
the current state

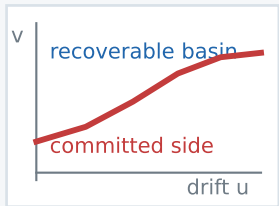
2 Zero-input test

ground acceleration = 0
same state and model
fixed continuation horizon

zero-input continuation

3 Barrier in (u, v)

static saddle = v = 0 point
of the separatrix



inside

4a Recoverable

state returns to the
elastic neighborhood

crossed

4b Committed

state escapes after
input removal

Hinge topology and capacity allocation

beam ends + bases
local hinge map

column ends added
admissible path

multi-bay budget
capacity split

barrier shifts
